

Week 1: Onboarding to SkillGrid

Saksham Boran

Roll No: 1024030856

2 September 2026

1 Context

This first week had no commits under my name – the initial scaffolding, CI/CD pipeline, and database setup were built by Yash. My time went into getting oriented in the codebase and the stack, and into planning what I'd be picking up once there was a real feature surface to build on.

2 Getting Oriented

Read through the scaffolded Next.js App Router project structure, the Vercel CI/CD pipeline configuration, and the initial Prisma schema (**User/Account/Session** for NextAuth, plus the project-specific **Profile** and **EvidenceRecord** models). Most of this stack was new to me going in – in particular:

- The App Router's split between server and client components, and why that split matters for anything touching the database directly (server components / server actions can call Prisma; client components can't).
- Prisma's migration model (**schema.prisma** as the source of truth, migrations applied against the real Neon Postgres instance rather than a local throwaway database).
- Why the project pins specific package versions (**next-auth@5.0.0-beta.32**, Prisma 6.19.3) instead of taking whatever **latest** resolves to – both cases where the newest tag targets a different architecture (Pages Router, a prerelease config rewrite) than what the project actually needs.

3 Planning

Discussed with the team how work would split going forward given the two onboarding paths already designed into the schema (resume/GitHub evidence vs. self-reported profile data). Agreed to pick up user-facing account surfaces – starting with a profile page – once the authentication and onboarding groundwork landed, which happened the following week.

4 Outcome

No code shipped this week. Ended it with a working local environment, a read of the schema and CI setup, and a concrete next task (the profile page) queued up for Week 2.
